OUR HIVIZ® CUSTOMER COMMITMENT

Innovation & Performance Are What We Do

HIVIZ® began in 1996 with a single product and the goal of advancing the art of shooting. For more than 25 years, we have been committed to this goal by continuing to offer high-quality and innovative products for shotguns, handguns, and rifles. From our unique, molded LitePipes to our patented LiteWave H3® tritium/fiber-optic sights, we continue to strive to be a leader in the shooting world. Today, as in the day we started, we are committed to providing you, our valued and loyal customers, with the best sights available to increase your success and enjoyment of the shooting sports.

We are proud to be installed as original equipment on many major brands, including Benelli, Browning, FN America, Henry Repeating Arms, Keltec, Kimber, Marlin, Mossberg, Remington, Rossi, Ruger, Savage, Smith & Wesson, and Taurus.

HIVIZ® FASTDOT H3® SIGHTS

Bright. Easy. Fast.

The newest and most innovative sight on the market designed for those who need a reliable sight that is bright, easy to acquire, and fast when you need it most. Leave behind the batteries and the bulk; stay on target with the FastDot H3®!

FAST SIGHT ACQUISITION

Fiber-optic front and rear sights provide bright and visible sights for easy acquisition right out of the holster.

EASY SIGHT ALIGNMENT

Conventional sight alignment is used, bringing the front sight into alignment with the rear. Instead of a blade centered in a notch, this is a circle within a circle.

POSITIVE SIGHT FEEDBACK

Once the sights are aligned, the rear sight will become a brighter green circle. No red from the front sight should be visible.

IMPROVED VISIBILITY AROUND SIGHT PICTURE

Reflex Sight: sits higher, view hindered by frame around the window

Standard Sight: visibility around the front sight is reduced by the rear sight

FastDot H3®: a single raised dot, high level of visibility around the sight

24-HOUR ILLUMINATION

Fiber optics produce a bright sight picture during the daylight to dim lighting conditions. As ambient light fades, the tritium will illuminate the sights. Does not require batteries or light to illuminate.

LOW-PROFILE DESIGN

Low-profile design with ability to use standard holsters.

FASTDOT H3® SIGHT SET FOR SMITH & WESSON
PAGE 32

HIVIZ® LITEWAVE H3® SIGHTS

The HIVIZ® LiteWave H3® line of sights for handguns and shotguns combines tritium with our very own legendary fiber-optic LitePipes for 24-hour illumination to bring you true day and night performance. The all-steel sight sets are rugged and dependable, designed for the roughest use, whether it is personal defense and protection, Law Enforcement, or Military.

The LiteWave H3 line ensures fast sight acquisition and a bright sight picture—day or night. The patented LiteWave H3 carries a 12-year tritium warranty for loss of illumination. Available for many popular handgun models, the LiteWave H3 sights duplicate manufacturer sight heights to ensure the same fit with holsters and accessories as factory sights.

HIVIZ® LITEWAVE® SIGHTS

HIVIZ® LiteWave® sights were designed to take the firearm sight to the next level. This innovative design features an integral LitePipe lock while the exoskeleton design adds to the LiteWave design's durability. This results in an incredibly bright sight picture in a variety of shooting conditions. All LiteWave sights are holster-friendly and are ready for rigorous use on the range or in the field.

ORIGINAL SIGHTS

Durable sights with interchangeable LitePipes in a variety of color options for an easily customized sight picture.

P22 FRONT SIGHT

TRITIUM CO-WITNESS
SIGHT SET FOR GLOCK MOS
PAGE 21

CO-WITNESS SIGHTS

HIVIZ® Co-Witness sights are designed to be used in combination with Red Dot Sight systems. Currently available in tritium and LiteWave® options for select models.

OVERMOLDED SIGHTS

The LitePipes in our Overmolded sights are locked in place with a clear resin that is injection molded around the LitePipe giving this design unsurpassed durability.

RUGER LCR FRONT SIGHT
PAGE 27

LITEPIPE TECHNOLOGY

No other sight company offers the simple interchangeability of LitePipes that HIVIZ® does. Our unique molded LitePipes allow you to remove, replace, and reuse the LitePipe. This offers shooters of all disciplines the opportunity to “customize” their sight picture—any place, at any time.

Our LitePipe combinations offer quick and easy target acquisition in any light condition. LiteWave handgun front sights come with White, Red, and Green pipes while rear sights come with two Black, two Red, and two Green pipes. Stock up on every color and size to customize your sight picture.

SHOTGUNS

MAGNETIC SIGHTS

We set the standard for magnetic sights! Easy to attach with strong, rare-earth magnets for a solid sight picture, giving you options with interchangeable LitePipes.

COMPARE MAGNETIC SITES ON PAGES 44 - 48.

PLAIN BARREL SIGHTS

These sights are designed specifically for shotguns without ribs. The simple snap-on design offers interchangeable LitePipes in an easy-to-attach design for any plain-barrel shotgun.

COMPARE PLAIN BARREL SITES ON PAGES 49 - 50.

SCREW ATTACH SIGHTS

Screw Attach sights offer the most-worry free and secure mounting option. Available in a variety of styles and colors.

COMPARE SCREW ATTACH SITES ON PAGES 51 - 53.

IF YOU ARE SIGHTING WITH THE PROPER EYE, YOU'LL SEE THE FULLY LIT SIGHT.

IF YOU ARE SIGHTING WITH THE WRONG EYE, THE SIGHT WON'T APPEAR LIT.

MAGNI-OPTICS® TECHNOLOGY

Conquer Cross-Eye Dominance & the Field

Does cross-eye dominance have you missing shots? Our patented Magni-Optics® Technology is just what you need to stay on target shot after shot. No other shotgun sight on the market combines a LitePipe with a unique magnifying chamber and lens to correct cross-eye dominance issues. This proprietary design improves the performance of cross-eye dominant shooters by encouraging both-eyes-open shooting.

The use of magnification ensures that the lighted sight picture is only visible when the shooter uses the correct sighting eye combined with the proper head and shooting position. Just as if you were looking through a rifle scope, only the shooting eye can see through the scope, only your shooting eye will see the LitePipe.

Cross-eye dominance is an issue that affects more than 40% of shooters, Magni-Optics allows cross-eye dominant shooters to shoot with both eyes open using their non-dominant eye.

SEE PAGES 45 AND 53 FOR PRODUCT INFORMATION.

MBP TACTICAL PAGE 50

RIFLES

ADJUSTABLE SIGHTS

HIVIZ® offers LiteWave® front sights combined with adjustable rear sights for many popular Henry Rifles and the popular Ruger 10/22. Also, check out our Universal Rear Sight to bring your shooting to the next level!

SHOOTING TIP

FOCUS

Shotgunners focus on their target and are aware of their sights, but it's just the opposite for handgunners.

Most combat and defensive handgun instructors preach "focus on your front sight and blur your target." Front sight acquisition and focus are tremendously aided by a bright, highly visible front sight.

Practicing and using the hard focus on the front sight will allow one to shoot more quickly and more accurately. Try it the next time you go to the range to practice, and compare your speed and accuracy to any other method.

SHOOTING TIP

TRIGGER FINGER

by Jerry Miculek

The key to a correct revolver grip is the placement of the trigger finger. The key to fast revolver shooting is to keep the trigger finger square on the trigger **(1)** throughout its entire arc of movement. You never want your finger to leave the face of the trigger anywhere during the firing sequence.

Get your hand as high as you can on the grip and still have the revolver functional. The web of the shooting hand is over the back strap **(2)**, so when you fire you have enough clearance for the hammer to cycle. You want the centerline of the bore to be close to the centerline of your hand. Your hand is high on the grip, and the barrel is held low. Use of the non-firing hand is 70% of your revolver control. Use both thumbs, wrap them over, and pull tightly. The big thing is consistency to the presentation of the target.

SHOOTING TIP

THE DRAW FROM THE SURRENDER POSITION

by Tony Holmes

Stand in the Isosceles stance with your left foot slightly forward pointing towards your first target. Your hands and wrists should be at shoulder height but not above your head (not like in the movies where they're reaching for the stars). The closer your hands are to your shoulders, the less travel they have to your pistol.

Position your holster between the appendix and full, strong side. Practice bringing your hands straight down from your shoulders to the holster, so that the grip of the pistol makes contact with your hand as it comes down. If it doesn't, move your holster to make it happen. Your weak hand will follow the strong hand down. After retrieving your pistol straight up from the holster, the pistol will come up and your weak hand will meet it around your strong hand as it comes into eye level. Disengage the safety and begin to push the pistol straight out at your first target. Your eyes should be focused on the target, and the sights will come to your eyes and the target. Prep the trigger and fire!

I've found that using electronic earmuffs helps in recognizing the sound of the beep quicker. Keeping your eyes on the target, focus on listening for the beep for your fastest reaction. It is not uncommon with practice to reach a .70 draw and hit a first shot at 10 yards.

MAGNETIC

HIVIZ® MAGNETIC SIGHTS: BRIGHT AND EASY TO INSTALL
WHEN YOU'RE LOOKING FOR THE BEST, TRUST THE ORIGINAL.

In 1996, HIVIZ® created the original magnetic shotgun sight and it continues to be the industry leader in this category. HIVIZ magnetic shotgun sights use powerful, rare-earth magnets to attach sights easily yet firmly to the rib of nearly any shotgun. Featuring easily replaceable LitePipes in multiple colors, HIVIZ has a magnetic shotgun sight that is perfect for you.

- Attaches directly behind factory bead
- Available in a variety of styles, colors, and sight diameters for every shooter's preference

NOTE: Sight must fit your exact shotgun rib width for proper installation. Not compatible with carbon fiber or aluminum ribs.

SEE PAGE 68 FOR OUR SHOTGUN SELECTION CHART.

SHOOTING TIP

FOLLOW THROUGH

There are three commonly accepted techniques for achieving forward allowance, or lead, on a moving target. They are: sustained (maintained) lead, pull-away, and swing (pull) through.

Which one you choose as your primary method is a matter of personal choice. However, in order to reach a higher level of ability, it's a good idea to get comfortable with all three.

Some target presentations may be more effectively shot with a different technique than your primary style.

The springing teal is a good example. Depending on the other target in a pair, you may have to attempt the teal rising, at its apex, or dropping. A large percentage of shooters will employ swing-through on the way up, sustained lead at the apex, and pull-away for the dropping teal.

During your practice sessions, you should practice with the different techniques on problem presentations and see what works best for you.

Regardless of the lead method you choose, follow-through is one of the most critical elements of a successful shot.

SHOOTING TIP

DETERMINE EYE DOMINANCE

With both eyes open, point your index finger at an object across the room. Now close your left eye. If you are still pointing at the object, as in #3, you are right eye dominant. If it appears you are pointing to the side of the object, as in #4, you are left eye dominant. There are varying degrees of eye dominance, but this is the most basic test.

Previous solutions to cross-eye dominance ranged from switching shoulders to obscuring the vision of the offending eye. Magni-Optic technology solves it instantly.

Be the best shotgun shooter you can be with Magni-Optics Technology. No other shotgun sight on the market combines a LitePipe with a unique magnifying chamber and lens to correct cross-eye dominance issues. This proprietary design makes better shooters by encouraging both-eyes-open shooting.

The use of magnification ensures that the lighted sight picture is only visible if the shooter uses the correct sighting eye and the head is in the proper shooting position. Just as if you were looking through a rifle scope, only the shooting eye can see through the scope, only your shooting eye will see the LitePipe.

Cross-eye dominance is an issue that affects over 40% of shooters, Magni-Optics allows cross-eye dominant shooters to shoot with both eyes open using their non-dominant eye.

SHOOTING TIP

TACTICAL SIGHT PICTURE & STANCE

by Mark Hotaling

HUNTING SIGHT PICTURE AND STANCE:

While hunting birds or shooting clays, the shooter will have an off-set stance with his shooting side foot set back behind him. The sight picture should be two eyes open, focusing on the target with the sight in his peripheral vision.

TACTICAL SIGHT PICTURE AND STANCE:

Very different than a hunting stance, the tactical shotgunner should have both feet roughly shoulder width apart, toes pointed at the target. The shoulders are nearly squared up with the target and the shooting side foot is only a couple of inches back from the other. The sight picture should be that of shooting a rifle or pistol: front sight aligned with the rear sight and when the trigger is pressed, his eye is solely focused on the front sight. With the proper tactical sight alignment, sight picture and front sight focus, the tactical shotgun can certainly be employed in a surgical manner, and the HIVIZ sight makes target acquisition much faster and more accurate.

SHOOTING TIP

CO-WITNESSING

Co-witnessing uses one sight system to zero or confirm zero of another sight system. In this tip, we are using back-up iron sights to co-witness an optic device because optic devices are susceptible to damage or failure. Co-witnessing an optic AR2008 makes it viable to switch an optic device between rifles or for confirming zero if the optic has been removed or suffered damage.

First, ensure zero of HIVIZ front/peep rear sights **(1)** at the desired range (usually zeroed at 25 yards and confirmed at 100 yards). Next, install the optic device and view the dot through the peep sight with the HIVIZ sight centered as if shooting **(2)**. Adjust the optic device until the dot is superimposed or forms a figure 8 on the HIVIZ front sight **(3)**.

Take your first shot using the optic device. Raise your head until the dot appears in the center of the optic **(4)**. Test fire to confirm point-of-impact at 100 yards and make any minor adjustment necessary.

Note: This technique will not work with higher mounts or magnified optic devices, such as the ACOG sight or conventional rifle scopes.

HIVIZ® Shooting Systems has always had a vision to improve the sport of shooting. Our goals are simple: break more targets, harvest more game, punch more holes in the 10-ring, and have fun doing it! Whether it's in the field, at the range, or for personal defense, HIVIZ has a sight to offer for a broad selection of shotguns, handguns, and rifles. Innovative, bright, and durable; you can depend on HIVIZ when it matters most. Shoot better. Shoot with confidence. Shoot HIVIZ Shooting Systems.
